KMA (Eun-Hee), NCEP (Fanglin), ECMWF (Nils)*

UN Early Warning for All Initiative

EW4All Initiative

The EW4All initiative is a groundbreaking effort to ensure that everyone on Earth is protected from hazardous weather, water, or climate events through life-saving early warning systems by the end of 2027.

The Early Warnings for All initiative is built around four key pillars:

Disaster risk knowledge

Systematically collect data and undertake risk assessments

- Are the hazards and the vulnerabilities well known by the communities?
- What are the patterns and trends in these factors?
- Are risk maps and data widely available?

Detection, observations, monitoring, analysis and forecasting of hazards

Develop hazard monitoring and early warning services

- Are the right parameters being monitored?
- Is there a sound scientific basis for making forecasts?
- Can accurate and timely warnings be generated?

Preparedness and response capabilities

Build national and community response capabilities

- Are response plans up to date and tested?
- Are local capacities and knowledge made use of?
- Are people prepared and ready to react to warnings?

Warning dissemination and communication

Communicate risk information and early warnings

- Do warnings reach all of those at risk?
- Are the risks and warnings understood?
- Is the warning information clear and usable?

EW4All Initiative: Approach to identify priority hazards

For the short-term activities of INFCOM, the six hazards were identified, mainly based on the hazards that were most frequently identified as “priority hazards” by the 30 countries*.

- **Flash-floods**
- **Drought/Dry spell**
- **Riverine Floods**
- **Tropical cyclone**
- **Thunderstorms/Squall lines**
- **Heatwave**

List of hazard types: defined by the implementation plan of the WMO Catalogue of Hazardous Events.

* List of the 30 countries can be found at:

<https://public.wmo.int/en/media/press-release/early-warnings-all-initiative-scaled-action-ground>

Number of countries
that identified the hazard as one of 5
priorities

Does your organization forecast one or more of the following hazards?

Modeling Centres	Flashfloods	Drought-dry spell	Riverine floods	Tropical Cyclones	Thunderstorms / Squall lines	Heatwave
ECCC	No	No	No	Yes	Yes	Yes
ECMWF						
CPTEC						
DWD	Yes	No	No	No	Yes	Yes
IITM	-	Yes	-	Yes	Yes	Yes
INMET	No	Yes	Yes	No	Yes	Yes
KMA	Yes	Yes	Yes	Yes	Yes	Yes
NCEP	Yes	Yes	Yes	Yes	Yes	Yes
Total	4	5	3	5	7	7

Yes

No

What is the timescale for which the hazard forecast is produced? If there is more than one, please indicate each of them

Modeling Centres	Flashfloods
DWD	localized warnings: a few hours ahead; pre-warnings and watches up to five days ahead
KMA	general hazard forecast: 3-5 days
CPTEC NCEP	7 days
ECMWF	Short

Modeling Centres	Riverine floods
INMET	one week
KMA	general hazard forecast: 3-5 days
NCEP	one week
ECMWF	Short, medium

What is the timescale for which the hazard forecast is produced? If there is more than one, please indicate each of them

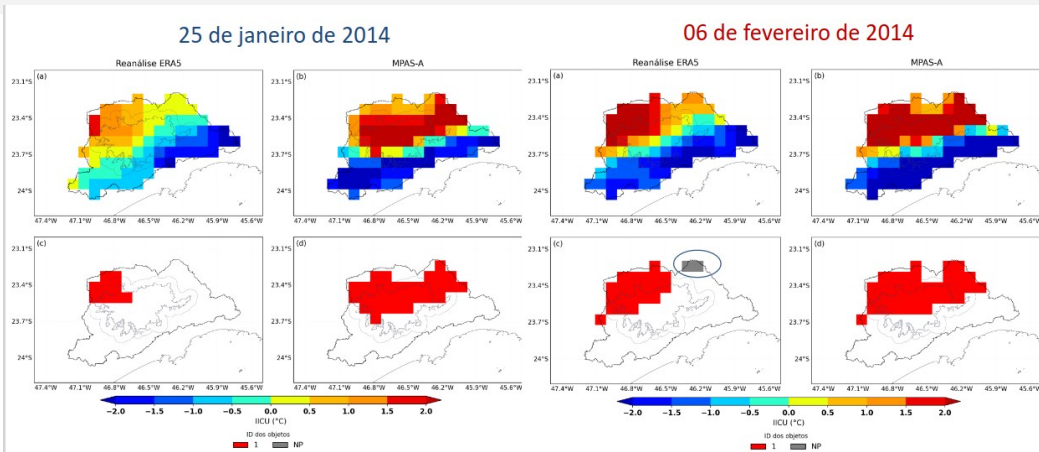

Modeling Centres	Tropical Cyclones
CPTEC	7 days
ECCC ECMWF	Short-range/ Long-Range
IITM	2-4 weeks
KMA	(1) general hazard forecast: 2-3days / (2) hazard warning : flexible. No regul.
NCEP	5 days
Modeling Centres	Thunderstorms / Squall lines
CPTEC	7 days
ECCC	Nowcasting/ Short-range/ Long-Range
DWD	localized warnings: a few hours ahead; pre-warnings and watches up to five days ahead
IITM	Nowcasting (Hours)
INMET	1 a 3 horas
KMA	(1) general hazard forecast: 2-3days / (2) hazard warning : flexible. No regul.
NCEP	day 1, 2, 3, 4-8
ECMWF	Short and medium-range

Has your organization been working on improving the modeled hazard? If so, please provide a reference paper

Modeling Centres	Tropical cyclones
CPTEC	Convection and cold pool parametrizations (Freitas et al., 2024)
ECMWF	Majumdar et al., (MWR, QJRM), Magnusson et al. (2024, in review), Polichtchouk et al. (2024 in review)

Verification methods used to assess the hazard forecasts

CPTEC - Spatial
verification of heat
waves (Araújo,
Frassoni, Sapucci
2025 in review)

	25/01/2014	06/02/2014
ACC	0,71	0,81

CEMS-Flood

Created by Francesca Di Giuseppe, last modified by Karen O'Regan on Apr 02, 2024

Copernicus Emergency Management Service - Floods (CEMS-Flood) include two operational services, both operated by ECMWF who have the responsibilities of running the forecasts, post-processing, and hosting the associated information system platforms.

EFAS is the European Flood Awareness System. It is operational since 2012 in collaboration with several European organisations responsible for producing and providing the flood information. It provides pan-European overview maps of flood probabilities up to 15 days in advance, seasonal streamflow outlooks up to 3 months ahead, and flash-flood risk.

Access To EFAS web
<https://european-flood.emergency.copernicus.eu/>

GloFAS is the Global Flood Awareness System. It is operational since 2018 and provides global overview maps of flood probabilities up to 30 days in advance and seasonal streamflow outlooks up to 4 months ahead.

Modeling system used to forecast the hazard

	Riverine floods - ECMWF	
	Global	Regional
Prediction timescale	NWP	NWP
Type of modeling system	Probabilistic	Probabilistic

Are the responses still valid? Is there a need to keep updating?

Considering to have a continuous update ...

Identify which of the highest-ranked systematic errors impact extreme events forecasts

- Update the WGNE Systematic errors questionnaire with a revision
- Update the questions to include extreme events
- Capturing changes over time
- Share the survey among major and NMHS's (RB collab)

Interested to contribute? Email me!

Thanks!

What is the timescale for which the hazard forecast is produced? If there is more than one, please indicate each of them

Modeling Centres	Drought-dry spell
CPTEC	3 months
IITM	2-4 weeks
INMET	3-5 months
KMA	(1) general hazard forecast: 2-3 days / (2) hazard warning : flexible. No regul.
NCEP	seasonal

Modeling Centres	Heatwave
CPTEC	7 days / 4 weeks
ECCC	Short-range / Long-Range
DWD	1-2 weeks
IITM	2-4 weeks
INMET	5 a 7 dias
KMA	(1) general hazard forecast: 2-3days / (2) hazard warning : flexible. No regul.
NCEP	day 6-10, day 8-14, week 3-4

Has your organization been working on improving the modeled hazard?

If so, please provide a reference paper

ECCC	A Convection Parameterization for Low-CAPE Environments. Monthly Weather Review, 148(12), 4917-4941
DWD	<p>Regional scale: development of the SINFONY system (www.dwd.de/sinfony), providing seamless probabilistic forecasts for precipitation, radar reflectivity and convective cell objects from 0-12 h lead time. It uses Nowcasting ensemble methods (reflectivity, precipitation, convective cell objects) to bridge the quality gap between the most recent observation and the most recent (but usually "old" in terms of init time) NWP-model. To make this NWP-model as recent as possible, we developed a new regional ICON Rapid Update Cycle with hourly forecast inits (ready 35' after the nominal init time), with advanced 2-moment cloud microphysics and improved assimilation of radar- and all-sky VIS and IR satellite data. This ICON-RUC is operational since July 2024.</p> <p>Global scale: improvements of the ensemble data assimilation system, use of more and more satellite data, tuning of model physics, new diagnostics like the Lightning Potential Index.</p>

CPTEC	Convection and cold pool parametrizations (Freitas et al., 2024)
KMA	Yes (no paper)

Is there any other high-impact weather, climate, or environmental hazard relevant to your location that is not listed?

DWD - Aviation forecasts: volcanic ash, turbulence Nuclear accidents: global dispersion modeling

ECCC - Winter-season hazards: blizzard, snowfall, freezing rain, wind chill etc

IITM - Cold waves, heavy rainfall events

KMA - Strong winds, cold waves, high sea waves
