# NWS Transformation

The National Weather Service (NWS) is transforming its science, technology, and operations to deliver more accurate, timely, and actionable environmental intelligence. Key efforts include advancing the **Unified Forecast System (UFS)**, **improving data assimilation**, **integrating AI/ML**, and **leveraging cloud infrastructure**. The transformation also expands **Impact-Based Decision Support Services (IDSS)** to help partners make informed decisions during high-impact events. By **modernizing its workforce**, tools, and partnerships, NWS is enhancing forecast accuracy, service delivery, and national resilience to weather, water, and climate hazards.

As part of the NWS transformation effort, the NCEP **Environmental Modeling Center (EMC)** and the OSTI **Meteorological Development Laboratory (MDL)** are being merged to streamline model development, testing, and operational transition. The new **Model Development Center (MDC)** will integrate EMC's numerical weather prediction expertise with MDL's applied modeling, statistical post-processing, and decision-support capabilities. This consolidation will strengthen collaboration, improve efficiency, and enhance consistency across the NWS modeling enterprise, enabling faster delivery of improved forecast guidance and services.

NOAA is collaborating with the US weather and climate science community to develop the next generation fully coupled earth system modeling capability for both research and operational forecast applications across different temporal and spatial scales.

### Regional:

**HAFS** - Hurricane Analysis and

Forecast System (parent 4km; nest 2km)

**RRFS** - North America Rapid Refresh

Forecast System (3km)

**AQM** - North American Air Quality

Model (12km)

### Global:

**GFS** - Medium-Range Deterministic Weather Forecast Model (9km)

**GEFS** - Global Ensemble Sub-Seasonal Forecast System (25km)

**SFS** - Seasonal Forecast System (50km)

**WAM** - Whole Atmospheric Model (up to 500 km; 50km)

**GCAFS** - Global Chemistry and Aerosol Forecast System (25km)

- WAVEWATCH III wave
- CICE6 sea-ice
- GOCART aerosols
- CMAQ air quality

- CMEPS mediator
- FV3 dycore
- CCPP physics
- MOM6 ocean
- Noah-MP LSM

# Joint Effort for Data assimilation Integration

## Infrastructure for Unified Data Assimilation

GSI in operations since 2007, but portions of the code are 30+ years old

JEDI is a project within the Joint Center for Satellite Data Assimilation (JCSDA)

JEDI provides a software infrastructure for DA that:

1. is model agnostic (but requires an interface to models!)
2. is generic and portable
3. does not impose specific methodologies or algorithms
4. allows to share efforts (new observation types, etc.) across different orgs.

## History & Current Status

## 10 Year Strategy

NATIONAL WEATHER SERVICE

# Unifying Physics Parameterizations for Major UFS Applications

	GFSv17 (9 km) & GEFSv13 (25 km) <b>SFS.v1 (50 km)</b> WAM (100km)	RRFSv1 (3-km) (multi-physics ensemble)	HAFSv2 (5.4/1.8 km)	AQMv7 (12km) aka Inline-CMAQ
Deep Convection	sa-SAS	<b>GF</b> and sa-SAS	sa-SAS	sa-SAS
Shallow Convection	sa-SAS	<b>MYNN-EDMF</b>	sa-SAS	sa-SAS

Radiation	RRTMG	RRTMG	RRTMG	RRTMG
Surface Layer	GFS	<b>MYNN</b> & GFS	GFS	GFS
PBL	sa-TKE-EDMF	<b>MYNN-EDMF</b> & TKE-EDMF	sa-TKE-EDMF	sa-TKE-EDMF
Land	NOAH-MP	<b>RUC</b>	<b>NOAH LSM</b>	<b>NOAH LSM</b>
oro and non-oro GWD	uGWP v1	<b>N/A</b>	uGWP.v1 (oro)	<b>uGWP.v0</b>
SS-GWD & TOFD	Yes	Yes	Yes	<b>No</b>

# Global Model Development Priorities: GFSv17

- Fully Coupled forecast model (atmosphere, land, ocean, ice, wave)
- Higher resolution (9-km)
- Major physics improvements including Noah-MP land model, PBL, convection, gravity waves, and Thompson Microphysics
- Unstructured Wave grids w/2-way coupling

**Scheduled for operational implementation in Q4FY26**

## Weakly Coupled DA

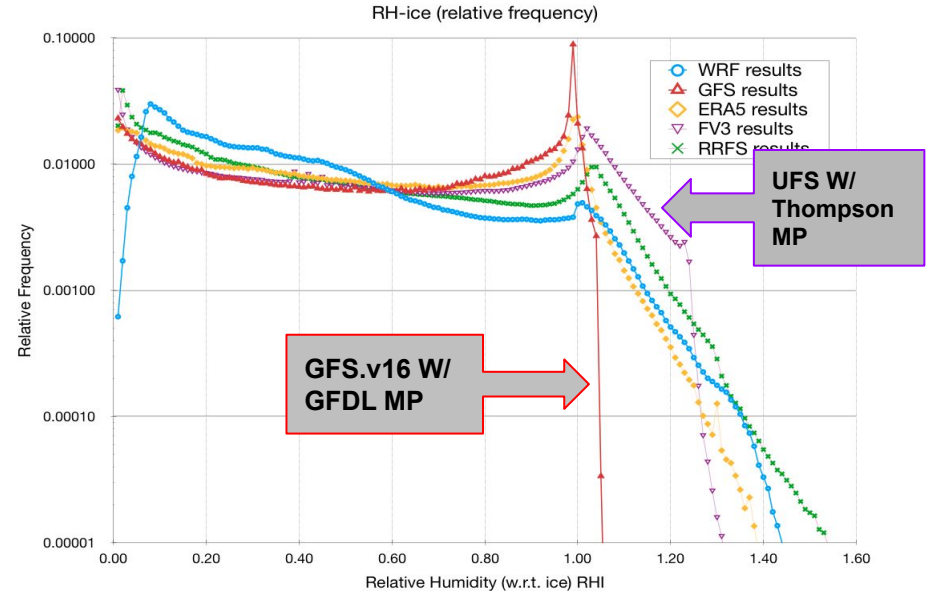

- **Atmosphere**
  - GSI-based hybrid 4D-EnVar deterministic analysis
  - GSI-based 4D-LETKF ensemble analysis
- **Marine**
  - **Sea-ice Ocean and Coupled Analysis (SOCA)**: ocean and sea ice are strongly coupled
  - JEDI-based 3DVar-FGAT for deterministic analysis
  - Ensemble forecast will be coupled and recentered about the deterministic analysis
- **Land**
  - JEDI-based 2DVar for **snow DA**
  - GSI-based 4D-LETKF for **soil moisture and soil temperature DA** (strongly coupled with atmosphere)

# Improving Supersaturation and Supercooled Cloud Water in Microphysics

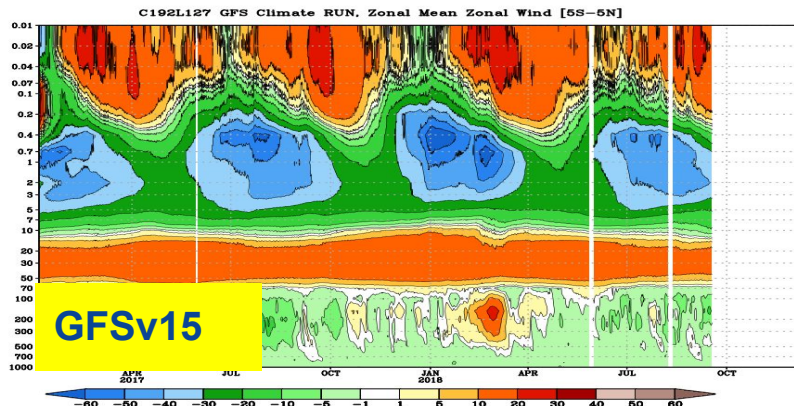

Observed frequency distribution (PDF) of RH relative to ice (RHI) from MOZAIC flight-level obs.

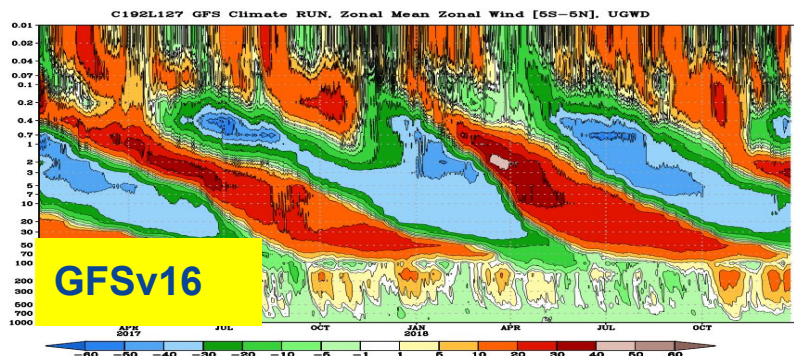

**RHI PDF from various models** (Credit: Greg Thompson). **Supercooled cloud water is a hazard to aviation**

# Better forecasts of the QBO with improved GWD parameterizations

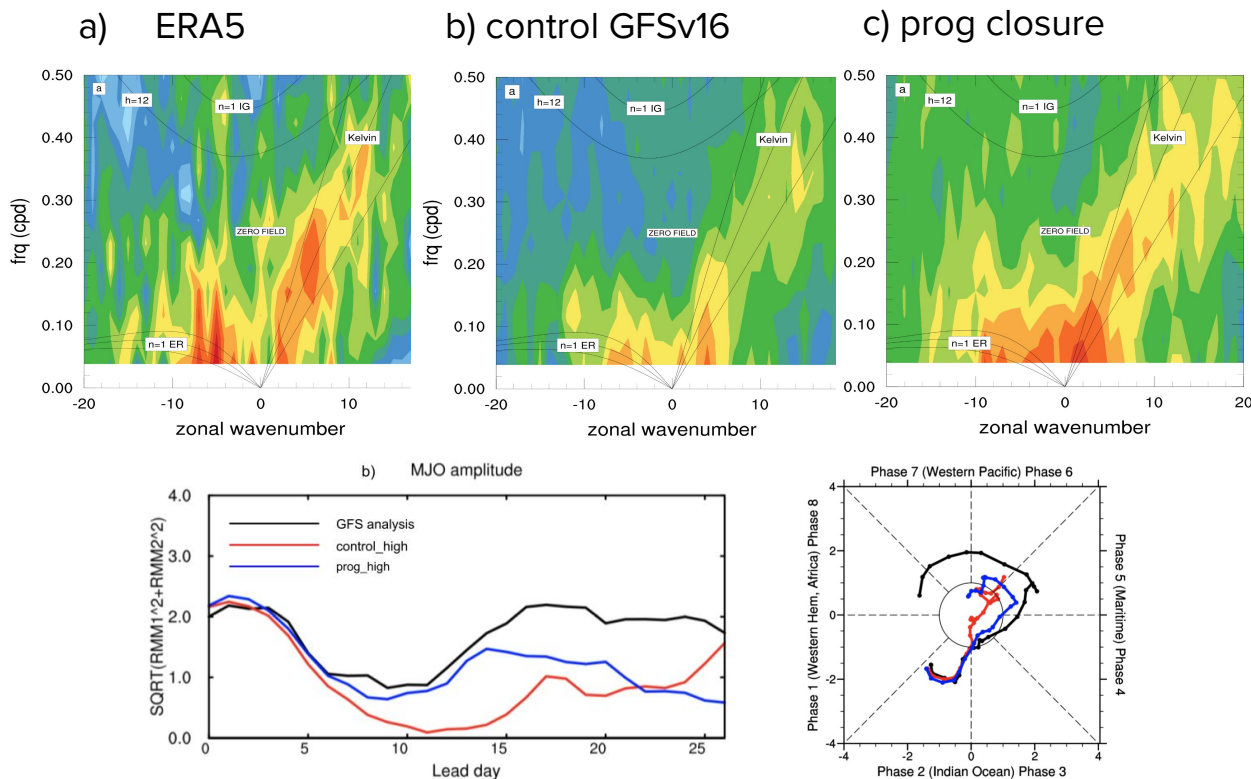

c384\_ugwv1\_1.0nf ugwv1 zonal mean zonal wind(5S,5N) averaged

# Regional Model: Rapid Refresh Forecast System (RRFS) A UFS Application

- Currently based on FV3 dynamical core Limited Area Model
- Hourly updated
- 3 km grid spacing over North America
- 65 vertical layers
- Hybrid 3DENVAR assimilation (30 members)
- Includes Smoke & Dust
- Deterministic forecasts to *at least* 18h every hour
- Deterministic & Ensemble forecasts to 48+h every 6 hours
- **RRFSv1 will be implemented into operations in early 2026**
- **RRFSv2**
  - Transition from FV3 dynamical core to MPAS
  - *Adding American Samoa and Micronesia Support to improve service to underserved communities*

# Hurricane Modeling at EMC

## HAFSv1.0 implemented in June 2023,

- First UFS-based application in operation

## HAFSv2.0 implemented in July 2024

- Increased horizontal resolutions,
- improved model efficiency and stability
- Improved Vortex Initialization
- Improved inner-core data assimilation system
- Introduced new ocean model MOM6

## Future Directions

- Multiple storm basin scale prediction
- AI-HAFS ensemble
- Merging HAFS with GFS

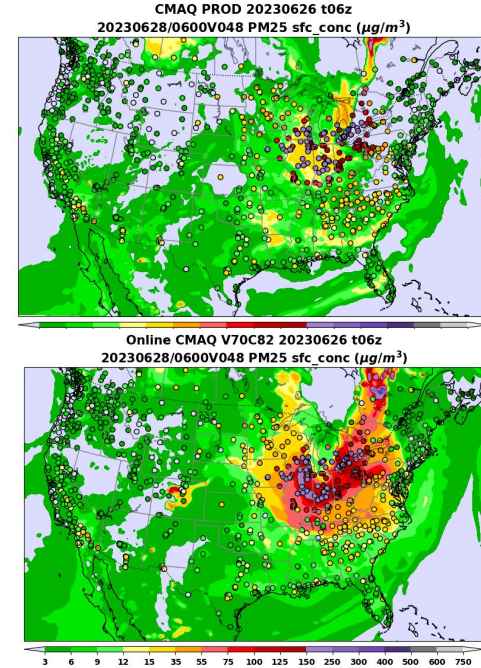

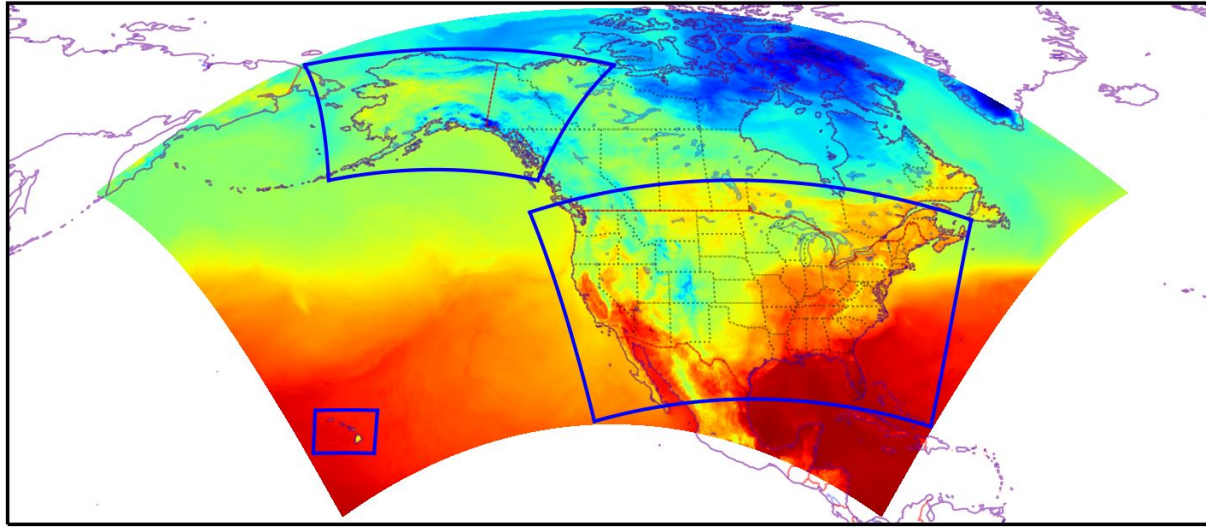

Hurricane Helene 09L, initialized at 2024092418

NATIONAL WEATHER SERVICE

# AQMv7: Online-CMAQ in UFS on a single large North American domain

- AQMv7 became operational in May 2024. It was the first UFS-based AQ modeling system with online meteorology and chemistry interaction, covers the North American large domain, replacing the previous offline model that ran over CONUS, AK and HI, separately.
- Primary products are **ozone PM2.5**

- Hourly RAVE wildfire emissions over the North American domain
- Anthropogenic and biogenic emissions for this domain (NEI 2016v1 plus global)

## UFS-AQM v8.0 Development and Implementation

- Upgrade the Common Community Physics Package (CCPP) to align with the version used in the Global Forecast System (GFS) v17.
- Upgrade CMAQ from version 5.2.1 to version 5.4.
- Update the National Emission Inventory (NEI) from 2016 to 2019.
- Refine fire emission representations and activate Volatile Organic Compound (VOC) emissions from wildfires.
- Improve PM<sub>2.5</sub> bias correction during intense wildfire events.
- The implementation is scheduled for 2026

# New Project: Global Chemistry and Aerosol Forecast system (GCAFS)

## Combining global aerosol, chemistry and regional AQ modeling

- With **nested domains** for regional high-res air quality forecasting
- Including **O3, NOx, SO2, CO, CH4, NH3** etc, and various aerosol components (including dust, sea salt, sulfate, black carbon, and organic matter)
- Provide O3 and other trace gases for radiation calculation in UFS global applications, including GFS/GEFS/SFS
- Include **fire behavior modeling**
- **Data assimilation** of aerosols and trace gas species
- **Reanalyses for AI/ML applications**

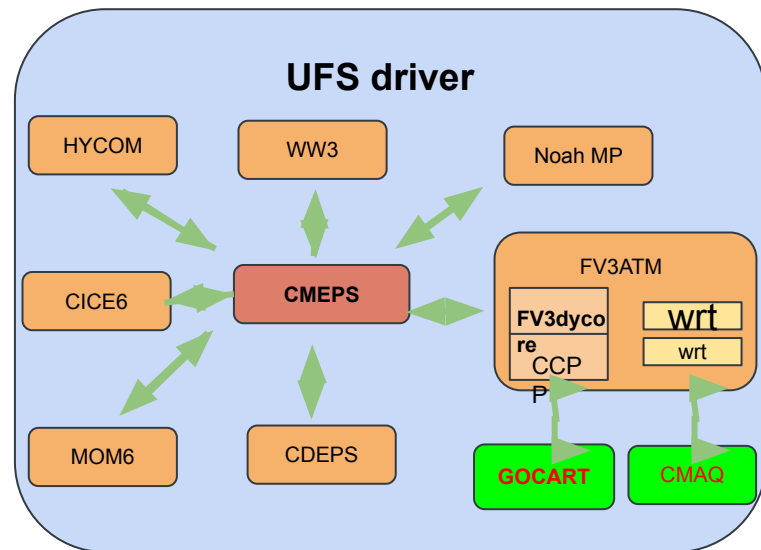

# Major Ongoing AI/ML Activities

- Global systems : AI-GFS, AI-GEFS, HGEFS, AI-GCAFS
- Regional systems: AI-HAFS, AI-RRFS
- ML Bias Correction
- Direct from Observations with OCELOT
- Generative AI: for scientific software development
- Collaboration with AI4NWP, NOAA Research Labs, and Private Sector
- Plan move toward Anemoi framework

# Thank you
